ABSTRACT

On the basis of information available to them in April 1973, representatives for the Higher Education Panel at 209 institutions gave estimates of the number of doctorates that would be awarded within each field of study during the academic years of July 1972-June 1973 and July 1974-June 1975. The figures reported afford a picture of the possible impact of the collective expectations. In general, doctorate production is expected to increase moderately, and most fields of study will have a share in this increased output. Only in physical sciences did representatives expect to see a somewhat lowered rate of doctoral output by 1975. If their estimates prove reliable, the relative proportion of doctorates contributed by each field of study will remain fairly stable. Only minor shifts will occur in the relative proportion of degrees granted in a given field of study by public and private institutions or by top 20, developing, or other institutions. Tabulated data are included to support the predictions. (Author/LBH)

Recent developments in the higher education community related to governmental and nongovernmental policy, changes in student aspirations, and changes in manpower and employment demand have created a need for current data on graduate enrollments and degree projections. The Higher Education Panel initiated this survey in order to provide indicators of the impact of recent institutional policy changes on Ph.D. production levels and to gain better baseline data for projecting trends in the availability of professionals in specified fields.

The questionnaire (see Appendix A) was mailed on April 3, 1973 to a sample of 219 institutions, out of a population of 314 Ph.D.-granting institutions. Each respondent was asked, first, to indicate the number of doctorate degrees the institution had conferred in each field between July 1971 and June 1972 and, secondly, to estimate the number it expected to confer in each field during two other years, July 1972-June 1973 and July 1974-June 1975 (see Appendix B for the definitions of major fields of study). For the purposes of this survey

This survey was conducted for the Federal government under a grant sponsored by the National Science Foundation, the National Institutes of Health and the U.S. Office of Education. Assisting in the preparation of this report were Joan C. Trexler and Richard M. Webb.

the doctoral classification included Ph.D., Sc.D., D.P.H., and Ed.D. degrees but excluded professional degrees such as the M.D., D.D.S., and D.V.M. degrees.

Completed questionnaires were received from 209 institutions for a response rate of 95.4 percent. Data provided by these sample institutions were statistically weighted in order to provide estimates of the number of doctorates that would be awarded at all Ph.D.-granting institutions during the three time periods. (See Appendix C for a description of sampling and weighting procedures.) The weighted figures shown here represent approximations to what would have been reported by the full population of Ph.D.-granting institutions; they are not, however, based on exact counts. Thus, for instance, the estimate reported here for the number of doctorates awarded in 1971-1972 is 33,729. In comparison, the figure reported by the National Research Council for 1971-1972 was 33,001. It should be be noted, however, that U.S. Office of Education figures on earned degrees have typically been somewhat higher than NRC figures. For 1970-1971, the USOE figures for the total number of degrees awarded was 32,113 whereas the total reported by the National Research Council was 31,772.

All figures for 1972-1973 and 1974-1975 are based on institutional projections or estimates. No assumptions were provided to the institutional representatives completing the questionnaire. Projections were to be based on their assessment of the impact of recent developments and the unique effect these developments have had or were anticipated to have on their institutions. The representatives who provided the estimates included a variety of institutional officers, including graduate and academic deans, directors of institutional planning or institutional research, and administrative vice-presidents.

Because they do not cover an extended period, the estimates given by institutional representatives for 1972-1973 and 1974-1975 were probably based on

National Research Council, <u>Doctorate Recipients From United States Universities</u>, <u>Summary Report</u>, 1972. Washington, D. C.: National Research Council, May 1973.

²United States Office of Education, <u>Earned Degrees Conferred</u>, 1970-1971, Washington, D.C.: Government Printing Office, 1973.

information about actual enrollments, known support levels, and budgets either existing or projected with some degree of certainty. Nevertheless, individual projections are likely to vary somewhat from the actual number of degrees conferred during these years. Similarly, the figures presented in this report are aggregated estimates that will not equal the number of degrees actually conferred during 1972-1973 or 1974-1975. As an indication, unpublished data from the 1972-1973 NRC Survey of Earned Doctorates show a figure of 33,727 doctorates awarded in 1972-1973, a two percent increase over the total number awarded in 1971-1972. In comparison, the figure reported here on the basis of institutional estimates was higher; the estimate was that 35,532 doctorate degrees would be conferred. The projections for 1974-1975 could be subject to similar variation from actual figures.

Discussion

The results of this survey (reported in Tables 1-11) indicate that the total number of doctorate degrees to be conferred are expected to increase moderately at least through the 1974-1975 academic year. Total doctorate production, based on current enrollments and the best judgment of the institutional representatives, was projected for 1974-1975 to increase by approximately eight and one-half percent above the reported production level of 1971-1972. This increase was anticipated in both public and private institutions, with the rate of growth in total doctorate production relatively equal in both sectors.

Table 1 presents percentage change data by field of study, institutional control (public, private) and year. For most fields of study, institutional representatives expected doctorate production to increase moderately over the

Data for 1972-1973 were obtained from Doctorate Record Files, Commission on Human Resources, National Research Council, Washington, D. C.

three-year period. The largest increases were expected in the health professions (24.2 percent) and in the "other fields" category (16.0 percent). In contrast, the only anticipated decrease (2.6 percent) was in physical sciences, while the number of engineering doctorates awarded each year was expected to remain about the same.

Total doctorate production for the 1974-1975 academic year was expected to increase by approximately the same rate within public and private institutions. However, specific fields of study tended to show a disproportionate rate of increase in favor of one sector of the population. With engineering, for example, institutional representatives at public institutions expected the number of doctorates awarded to increase 3.5 percent by 1974-1975, whereas representatives at private institutions expected the number of doctorates in engineering to decrease 3.5 percent by that year. Similarly, substantial gains were expected for the arts and humanities, mathematical sciences, and "all other fields" in the public sector (14.0 percent, 16.3 percent, and 19.9 percent, respectively) while only moderate gains or losses were expected for these fields in the private sector (7.3 percent, -2.8 percent, and 7.9 percent, respectively). In contrast, the life sciences and social sciences reported sizeable gains in the private sector (19.1 percent and 15.7 percent) and only moderate gains in the public sector (8.5 percent and 6.8 percent). One field, health professions, was expected to increase considerably in both sectors although the largest increase was expected at public institutions.

Tables 2-6 are refinements of Table 1. The estimated number of doctorates to be awarded and the numerical and percentage change in doctorate production by field and year for all institutions and for public and private institutions are shown in Tables 2 through 4. Percentage distributions by field (Table 5) and by institutional control (Table 6) are presented separately.

Although noticeable increases are projected in a number of fields of study for both public and private institutions, the proportions of each year's total doctorate production attributable to each field of study were expected to remain fairly constant (Table 5). Over the three time periods covered by the survey, only minor changes are detected in the proportion of the total doctorates to be conferred in each field. Thus, for example, 15.6 percent of the doctorates awarded in the 1971-1972 academic year were granted in the arts and humanities while the corresponding percentage for 1974-1975 is 15.9 percent. Although this difference is relatively small, it is not atypical of the differences noted for the other fields of study. Table 5 presents similar data for all fields, time periods, and types of institutions dealt with thus far.

This consistency also holds true when controlling for type of institution.

As can be noted in Table 6, the proportion of doctorates in each field that would be awarded by public and by private institutions is expected to remain stable across the three points in time. Although there are minor variations, no significant differences are expected.

Tables 7-9 report doctorate production estimates by field of study, academic year and by type of institution. Reference is made in the tables to "top twenty" and "developing" institutions. The "top twenty" were designated on the basis of National Science Foundation Fellows most frequently selecting these institutions for graduate study and on the basis of the largest amounts of Federal research and development money awarded. These twenty institutions accounted for almost 30 percent of all doctorates awarded in science and engineering in 1971-1972 (Table 11). Developing" institutions are those which awarded science or engineering doctorates for the first time in 1960 or later. They accounted for

Science and engineering as used here refer to the following major fields as listed on the survey instrument in Appendix B: engineering, life sciences, mathematical sciences, physical sciences, and social sciences.

about 7 percent of all science and engineering doctorates in 1971-1972.

The "top twenty" institutions were estimated to show little overall change between 1971-1972 and 1974-1975 in levels of doctorate production, although some changes among specific fields were expected. Decreases were anticipated in engineering, mathematical sciences, and physical sciences. The expected losses in these fields contrast with the large expected gain in the health professions.

From Tables 8 and 9, it can be seen that both "developing" and "all other" institutions were expected to increase their doctorate production in the 1974-1975 academic year by a greater percentage than the national average, with "developing" institutions increasing by 38.9 percent. In "developing" institutions, often sizeable gains were expected for particular fields of study; it should be noted, however, that these percentage increases are partially an artifact of the small base Ns for these fields. The "developing" institutions were expected to grant only 9.5 percent of the total number of doctorate degrees in 1974-1975 (Table 11).

Summary

On the basis of information available to them in April of 1973, representatives for the Higher Education Panel at 209 institutions gave estimates of the number of doctorates that would be awarded within each field of study during the academic years of July 1972-June 1973 and July 1974-June 1975. The figures reported here afford a picture of the possible impact of their collective expectations. In brief, doctorate production is expected to increase moderately, and most fields of study will have a share in this increased output. Only in physical sciences did representatives expect to see a somewhat lowered rate of doctoral output by 1975. If their estimates prove to be reliable, the relative proportion of doctorates contributed by each field of study will remain fairly stable (Table 10). Similarly, only minor shifts will occur in the relative proportion of degrees granted in a given field of study by public and private institutions (Table 6) or by top twenty, developing, or other institutions (Table 11).

Appendix B

FIELDS OF STUDY

Doctorate: The doctoral classification includes such degrees as the Ph.D., Sc.D., D.P.H., and Ed.D. but excludes professional degrees such as the M.D., D.D.S., and D.V.M.

Arts and Humanities: Include English, literature, foreign languages, history, architecture, fine and applied arts, philosophy, religion, etc.

<u>Health Professions</u>: Include nursing, hospital and health care administration, public health, pharmacy, and other allied health fields.

Other Life Sciences: Include other biological sciences such as botany, zoology, anatomy, entomology, etc., and other life sciences such as agriculture and forestry.

Mathematical Sciences: Include mathematics, statistics, computer sciences, data processing, systems analysis, and all related fields.

Other Physical Sciences: Include astronomy, atmospheric sciences and meteorology, geology, geophysics, metallurgy, oceanography, paleontology, pharmaceutical chemistry, etc.

Other Social Sciences: Include anthropology, archeology, geography, political science, government, and demography. History students should be reported in Arts and Humanities. Public affairs and services such as public administration, social work, and law enforcement, and other applied social sciences such as criminology, international relations, and urban studies, should be included in All Other Fields.

<u>All Other Fields</u>: Include all fields other than those indicated above, for example, area studies, communications, home economics, library science, public affairs and services, and applied social sciences.

Appendix C

.Sampling and Weighting Procedures

The eligible population for this survey consisted of 314 Ph.D.-granting institutions (168 public institutions and 146 private institutions). Data on doctorate production levels were solicited from a sample of 219 institutions (69.7 percent of the eligible population). Returns were received from 209 institutions (95.4 percent). Of these, five institutions could not provide data for 1971-1972, ten could not provide data for 1972-1973, and fourteen could not provide data for 1974-1975. Consequently, the data presented for 1971-1972 are based on returns from 204 institutions, 1972-1973 on returns from 199 institutions, and 1974-1975 on returns from 195 institutions. Because of the differential response rate for the three time periods, data were weighted separately for each year to provide estimates of population figures and to increase the comparability of the data.

The population of 314 institutions was classified into the following strata:

| A | - | | • • • • | |
|---------|---|--------|--------------|--|
| Stratum | | Public | universities | |

Stratum II Private universities

Stratum III Public four-year colleges

Stratum IV Private four-year colleges

Stratum V Public independent medical schools

Stratum VI Private independent medical schools

Stratum VII All seminaries

The doctoral production estimates reported in the sample by responding institutions were weighted to provide aggregate estimates of population figures. The aggregate estimator used was:

$$x'_r = \sum_{h=1}^{L} \frac{z_h}{\sum_{i=1}^{n_h} w_h x_{hi}}$$

where W is a stratum weight, the ratio of the number or institutions in the population to that in the sample for the h th stratum.

 \mathbf{X}_{hi} is the number of doctoral degrees conferred as reported by the i the sample institution in the \mathbf{h}^{th} stratum.

z_{hi} is the number of doctoral degrees conferred in the corresponding field (or field aggregate) as reported to HEGIS VI for the ith sample institution in the hth stratum.

 \mathbf{Z}_{h} is the total doctoral count in the corresponding field (or field aggregate) as reported to HEGIS VI for the \mathbf{h}^{th} stratum.

L is the number of strata defining a reporting category.

The HEGIS data on doctoral degrees conferred was used to provide a ratio adjustment factor in these estimates. In the absence of data on doctoral production counts for later years, the HEGIS data for 1970-1971 were used in the computation of the ratio estimator for all three time periods. Note that separate ratio adjustments were made for each field estimate.

To estimate the precision of these estimators, the relative variance was computed as:

$$\sigma_{x_{r}}^{12} = (x_{r}^{1})^{2} (v_{x}^{2} + v_{z}^{2} - 2p_{xz} v_{x} v_{z})$$

where $V_{\rm x}^{-2}$ is the estimated population relative variance of the doctoral production count, as reported by the sample institutions, $V_{\rm z}^{-2}$ is the estimated population relative variance of the doctoral production count as reported to HEGIS by the sample institutions, and the last term is twice the covariance between them. Each of these terms were separately estimated from the sample data within strata and combined across strata to estimate the population variance in the reporting category, which consisted in each case of one or more strata.

The 95 percent confidence limits appearing in Tables C2 and C3 were obtained by taking the square root of the absolute variance and multiplying it by 1.96. Thus, the total number of doctorates to be conferred during the period July 1974 to June 1975 in arts and humanities is estimated to be 5,818 with a 95 percent confidence interval of + or -227.

Table C1 reports for all institutions the number of institutions used to estimate each field of study for the sample and the population. Weights were subsequently obtained for each field of study by year, by stratum. The resulting range of weights developed for each field and year for the seven strata is also reported in Table C1.
